NETGEAR Insight 10.0 FAQs

Everything you need to know about the new era in cloud network management — for IT administrators and MSPs

What's new in NETGEAR Insight 10.0

What is NETGEAR Insight 10.0?

NETGEAR Insight 10.0 is a completely reimagined cloud management platform designed for IT managers and Managed Service Providers (MSPs). Developed with direct input from customers and UX experts, this release delivers a modernized interface, AI-powered intelligence (in BETA), advanced visual reporting, and a simplified subscription model — all in a single, transparent platform that manages routers, switches, access points, mobile hotspots and security from anywhere in the world.

What inspired the update of NETGEAR Insight 10.0?

Every design decision in Insight 10.0 was informed by real-world customer feedback, UX research, and collaboration with IT administrators and MSPs. The goal was to reduce administrative overhead, eliminate hidden complexity, and deliver a platform that makes network management intuitive at any scale — from a single office to a complex multi-site enterprise.

What are the most significant changes from the previous version of NETGEAR Insight?

- Completely modernized UI built on MUI (Material UI), redesigned through extensive user feedback and UX best practices
- AI-designed networking (in BETA) to simplify provisioning, streamline network onboarding and reduce errors
- Consolidation of Premium and Pro subscription tiers into one unified, transparent plan
- New map-based visual reporting and WiFi heatmaps for actionable coverage intelligence
- Redesigned hierarchy tree for faster navigation across multi-site and multi-client deployments
- Simplified two-step sign-up and accelerated zero-touch device onboarding

Do existing Insight customers need to take any action to upgrade to 10.0?

No action is required. Insight 10.0 is a software update that applies automatically to all active Insight subscriptions. Your existing network configuration, devices, and account settings are fully preserved during the upgrade. The new interface will be available the next time you log in to your Insight account.

Will my current NETGEAR devices still work with Insight 10.0?

Yes. Insight 10.0 is fully backward-compatible with all previously supported NETGEAR managed devices, including switches, routers, and access points. No hardware changes are required to take advantage of the new platform.

Subscription and pricing

What does the new single-tier subscription mean for me?

Insight 10.0 replaces the previous Premium and Pro subscription tiers with one unified plan. Every managed device on your account is covered by the same flat rate. There are no feature add-ons, no hidden modules, and no tier lock-in. Every capability — including WiFi heatmaps, topology views, and role-based access control — is included for all managed devices under your subscription.

What happens to my existing subscription if I was on the old Premium or Pro tier?

Existing Premium and Pro subscribers are automatically migrated to the new unified subscription. Your network data, device configurations, and billing continuity are maintained throughout the transition. You will gain access to all new Insight 10.0 features immediately after migration.

How is the subscription priced and where can I find current rates?

Insight 10.0 uses a per-device subscription model. Visit netgear.com/insight or contact your NETGEAR sales representative for current pricing, volume discounts, and MSP partner rates. The NETGEAR Enterprise team can be reached at https://www.netgear.com/support/enterprise/.

Features & capabilities

What is included in the NETGEAR Insight 10.0?

- Manage: Zero-touch device onboarding, bulk configuration templates, scheduled firmware updates, multi-site management, role-based access control (RBAC), mobile app for iOS and Android
- Visualize: Single pane of glass dashboard, map-based site reporting, WiFi coverage heatmaps, live topology diagrams, historical traffic analytics, AI-designed networking (in Beta)
- Secure: WPA3 enterprise encryption, VLAN segmentation, guest network isolation, anomaly detection and alerts, VPN management, GDPR-compliant data handling
- Cloud: 24/7 cloud DevOps operations, 99.9% uptime SLA, continuous device operation during cloud maintenance windows

What are WiFi heatmaps and how do I use them?

WiFi heatmaps provide a visual representation of wireless signal strength and coverage across a physical floor plan. You upload your floor plan image and Insight overlays real-time coverage data from your access points, clearly showing where the signal is strong, where it weakens, and where gaps exist. Heatmaps help you identify coverage issues proactively — before your users experience them. They also assist with operations and troubleshooting by visualizing AP-related key metrics on the heatmap itself.

Which NETGEAR devices can be managed with Insight 10.0?

Insight 10.0 manages NETGEAR routers, managed and smart switches, wireless access points, mobile hotspots and security.

How does the single pane of glass work across multiple sites?

Insight 10.0 organizes your network in a clear hierarchy: Account → Organization → Location → Device Group → Devices. You can navigate between levels using the hierarchy tree, see a real-time map view of all your locations with live health scores, and drill down into any site, device group, or individual device. Every level provides bulk management, configuration templates, and role-based access control.

What is Role-Based Access Control (RBAC) and how does it work?

RBAC allows you to assign specific permissions to different users based on their role in your organization. For example, a network engineer may have full configuration access while a helpdesk operator has read and troubleshoot permissions only. Roles can be applied at the organization, location, or device group level — making it straightforward to manage access for large teams, client accounts, or mixed-responsibility environments.

What is the NETGEAR Insight AI-designed networking (in BETA) and what can it do?

The Insight AI-designed networking, currently in BETA, enables faster project execution by dramatically reducing project deployment timelines, enabling teams to quickly stand-up network infrastructure. It eliminates manual configuration errors that typically occur during network setup, improving reliability, and uptime. And removes the need for customers to learn vendor-specific nuances and menu structures, making network deployment accessible to a broader range of users.

What reporting capabilities does NETGEAR Insight 10.0 include?

- Real-time and historical device metric monitoring and reporting
- Client connection tracking and usage visibility
- Config change tracking with audit trail
- Customer data captured via the Instant Captive Portal
- Customizable troubleshooting reports
- Single pane of glass snapshot overview of all organizations' metrics

Is there a mobile app?

Yes. The NETGEAR Insight mobile app is available for both iOS and Android. It provides full management access from your smartphone or tablet — including device deployment, alert management, network health monitoring, and troubleshooting — from anywhere in the world.

Onboarding, security & MSP management

How do I get started with NETGEAR Insight 10.0?

Sign-up takes two steps: create your NETGEAR account and add your first managed device. The streamlined onboarding flow guides you through both steps in minutes. Visit netgear.com/insight to get started. Existing customers will find their accounts automatically updated when they next log in.

How does zero-touch device onboarding work?

NETGEAR managed devices automatically connect to your Insight account when powered on and connected to the internet. No manual configuration at the device level is required. Bulk configuration templates allow you to apply standardized settings — SSIDs, VLANs, security policies, firmware schedules — to any number of devices simultaneously, dramatically reducing deployment time for new sites.

How long does it typically take to set up a new site?

With zero-touch onboarding and bulk configuration templates, a 50-device site can typically be operational in an afternoon. The streamlined two-step sign-up and pre-configured templates eliminate the manual steps traditionally associated with network deployments, saving IT teams and MSPs significant time on every new engagement.

What security features are included in NETGEAR Insight 10.0?

- Multi-Factor Authentication (MFA) is enforced at login for all portal users
- Brute-force protection with rate-limiting and automatic account lockout
- Role-Based Access Control (RBAC) with granular permissions per user
- JWT token authentication secures all API sessions
- VPC-isolated cloud infrastructure with TLS 1.2+ encryption in transit and at rest
- 24/7 cloud DevOps monitoring with 99.9% uptime SLA
- Multi-PSK (MPSK) support for per-device or per-user unique wireless passphrases

Is NETGEAR Insight 10.0 CCPA and GDPR compliant?

Yes. Insight 10.0 is built on NETGEAR's secure cloud infrastructure with GDPR-compliant data handling practices. Network management data is protected in accordance with applicable data protection regulations. For specific data processing and residency questions, contact your NETGEAR sales or support representative.

What happens to my network if the cloud connection is temporarily interrupted?

NETGEAR devices continue to operate normally during any cloud connection interruption. Traffic continues to flow, configured settings remain active, and previously applied policies stay in effect. The Insight management platform resumes full monitoring and management capability automatically when connectivity is restored — with no manual intervention required.

How does NETGEAR Insight 10.0 support MSPs managing multiple clients?

Insight 10.0's hierarchical structure is purpose-built for MSP workflows. You can create separate organizations for each client, each with its own isolated configuration, device inventory, user permissions, and reporting. The hierarchy tree provides rapid navigation between client accounts. Bulk templates and role-based access control enable efficient management at scale, and you can assign read-only or restricted access to client contacts without exposing other organizations in your portfolio.
